WHAT IS CLAIMED IS:

	and the second of the second o
1	1. An electronic equipment which is used while being connected to
2	a display device, said electronic equipment comprising:
3	a display action, a display action of the last a receiving part which receives input signals from N pieces (N≧
4	2) of pointing devices; and
· 5	a pointer control part which decides respective display positions
	of N pieces of pointers displayed on said display device based on input
5 6 7	signals which said receiving part receives.
Print Divis	2. An electronic equipment which is used while being connected to
1	
2	a display device, said electronic equal equa
2 3 4	a first receiving part which receives a sale of
4	pointing device;
:=!: 5	a second receiving part which receives a second input signal from
é	a second pointing device;
	e first pointer control part which decides a display position of a
	first pointer displayed on said display device based on said first input
	. 1. 1 said first receiving part receives; and
	signal which said instructions is signal which decides a display position of a a second pointer control part which decides a display position of a
1	a second pointer control pure device based on said second
1	second pointer displayed on said display device based on said second
1	2 input signal which said second receiving part receives.

3. An electronic equipment according to claim 2, said electronic

equipment further comprising: a display content decision part which decides the display considered of said display device in response to said first input signal, said input signal, information indicative of the display position of said input signal, information indicative of the display position of said input signal, information indicative of the display position of said input signal, information indicative of the display position of said input signal, information indicative of the display position of said input signal, information indicative of the display position of said input signal, information indicative of the display position of said input signal, information indicative of the display position of said input signal, information indicative of the display position of said input signal, information indicative of the display position of said input signal, information indicative of the display position of said input signal, information indicative of the display position of said input signal.	
6	intermation indicative of the display position of said sect
7	pointer.
1	4. A method for deciding the display position of a pointer, said

1 2

Traffi

- method comprising the steps of:

 receiving a first input signal from a first pointing device;

 deciding the display position of a first pointer displayed on a

 display device based on said first input signal;

 receiving a second input signal from a second pointing device; and

 deciding the display position of a second pointer displayed on said

 display device based on said second input signal.
- 5. A storage medium for recording a program, which is executed on a computer, said program comprising the steps of:
- receiving a first input signal from a first pointing device;
- fixing a position of a first pointer, which is displayed onto a display device, by calculating said first input signal;
- receiving a second input signal from a second pointing device; and fixing a position of a second pointer, which is displayed onto a display device, by calculating said second input signal.
- 6. A program for making a computer execute following processing

2	which	comprises:
---	-------	------------

- processing which receives a first input signal from a first pointing 3 device and decides the display position of a first pointer displayed on a 4 display device based on said first input signal; and 5
- processing which receives a second input signal from a second 6 pointing device and decides the display position of a second pointer 7 displayed on said display device based on said second input signal. 8

7. An electronic equipment comprising:

- a first connecting part for connecting said electronic equipment to a display device;
- a second connecting part for connecting said electronic equipment to a first pointing device;
- a third connecting part for connecting said electronic equipment to a second pointing device; and
- a display control part which displays, when said display device is connected to said first connecting part, a first pointer which is displaced based on an instruction from said first pointing device which is connected to said second connecting part and a second pointer which is displaced based on an instruction from said second pointing device which is connected to said third connecting part on said display device.
- 8. An electronic equipment according to claim 7, said electronic 1 equipment further comprising: 2
- a processing part which specifies a position which becomes the 3 reference or an object which becomes a subject on a display screen of said 4

- 6 second pointing devices, and decides the content of a manipulation to said
- 7 position which becomes the reference or said object which becomes the
- 8 subject based on the other instruction.
